Unresolved Issues (<i>problems to be solved</i>)		
<u>Issue No. & Key Points</u>	<u>Details</u>	<u>Owner</u>
1.Website server establishment on provided Linux system	As I learned, to establish a website server on provided Linux system, we might be supposed to configure JDK and Tomcat, open the server connection port, and even install some related server softwares. However, on the linux machine, we don't have the authority to do this, there is a password required from IT Service. Hence, do we need to ask for authority and configure the web server all by ourselves, or there are some other ways, or any guidance? (Because it was not mentioned in last term's DBI lectures, which make us a little bit confused)	<u>Yinglun LI</u>
